

NAGRA Seven SERVICE BULLETIN FOR THE VERSION V1.70

This version has a new format for the internal parameters of the Nagra Seven, and its installation will NOT erase the settings and parameters saved with previous versions.

New features

- TCP : Display of a web page in text format for use when a connection is made requiring a login (in a hotel for example). The Seven displays the fields to be completed(ex: user/password)in text mode. As there is no "standard" for login pages it is possible that the Seven will not display all pages.
- Playback loop : A new setting « Index loop » has been added in the menus « Auto skip in playback », it allows an index to be repeated in playback continuously : at the end of the index it restarts immediately without any break. Search fonctions << and >> start and stop at the begining of the index. SKIP must be used to change index.
- Markers : Diaplay of the number of markers in the current index as well as the number of the previous marker from the current position. For exampler : 4/7 indicates that we are located on or after the 4th marker from a total of 7.
- More error information while formatting a media.
- Modulometer: Addition of more values, those of the K-system, for the limit of the yellow and red zones.
- SIP : improvement of compatibility with certain SIP servers. Increased the time out period during login to a SIP server.
- Improvement of the internal clock precision

Bug corrections:

- The play of an index importation stopped if the working directory was empty.
- The Seven stopped if the editor was opened from the directory and them immediately closed without modification.
- The Seven would not restart following a cut of from « low batt » during editing.
