

Audirvana Plus configuration

Make sure you have Audirvana Plus version 1.5.12 or higher.

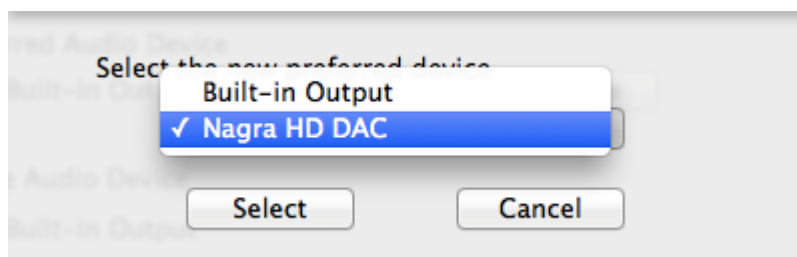

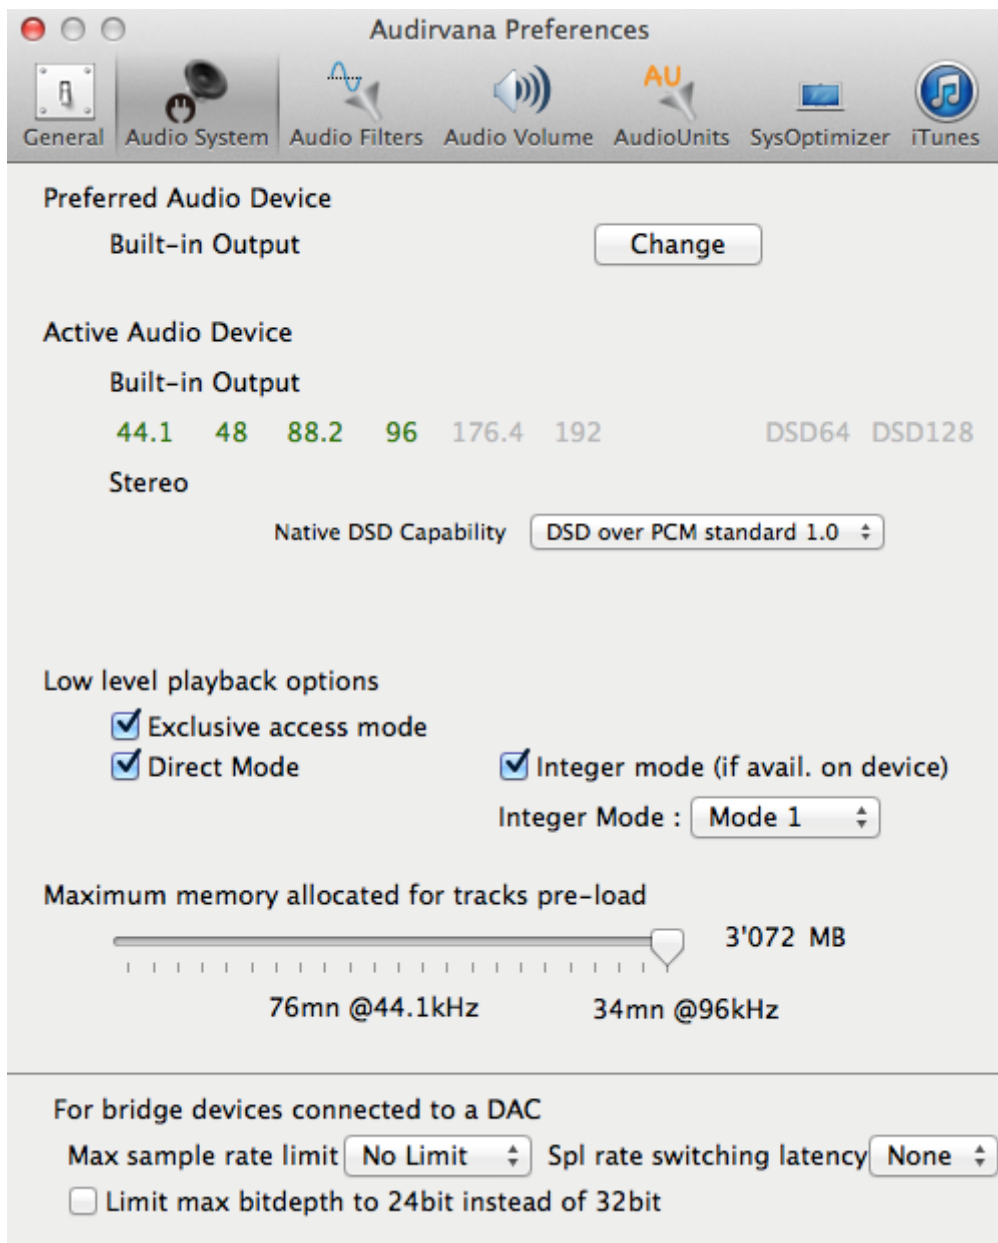

First step

Launch Audirvana Plus on your Mac. Then connect the HD DAC, go to the **Preferences** menu.

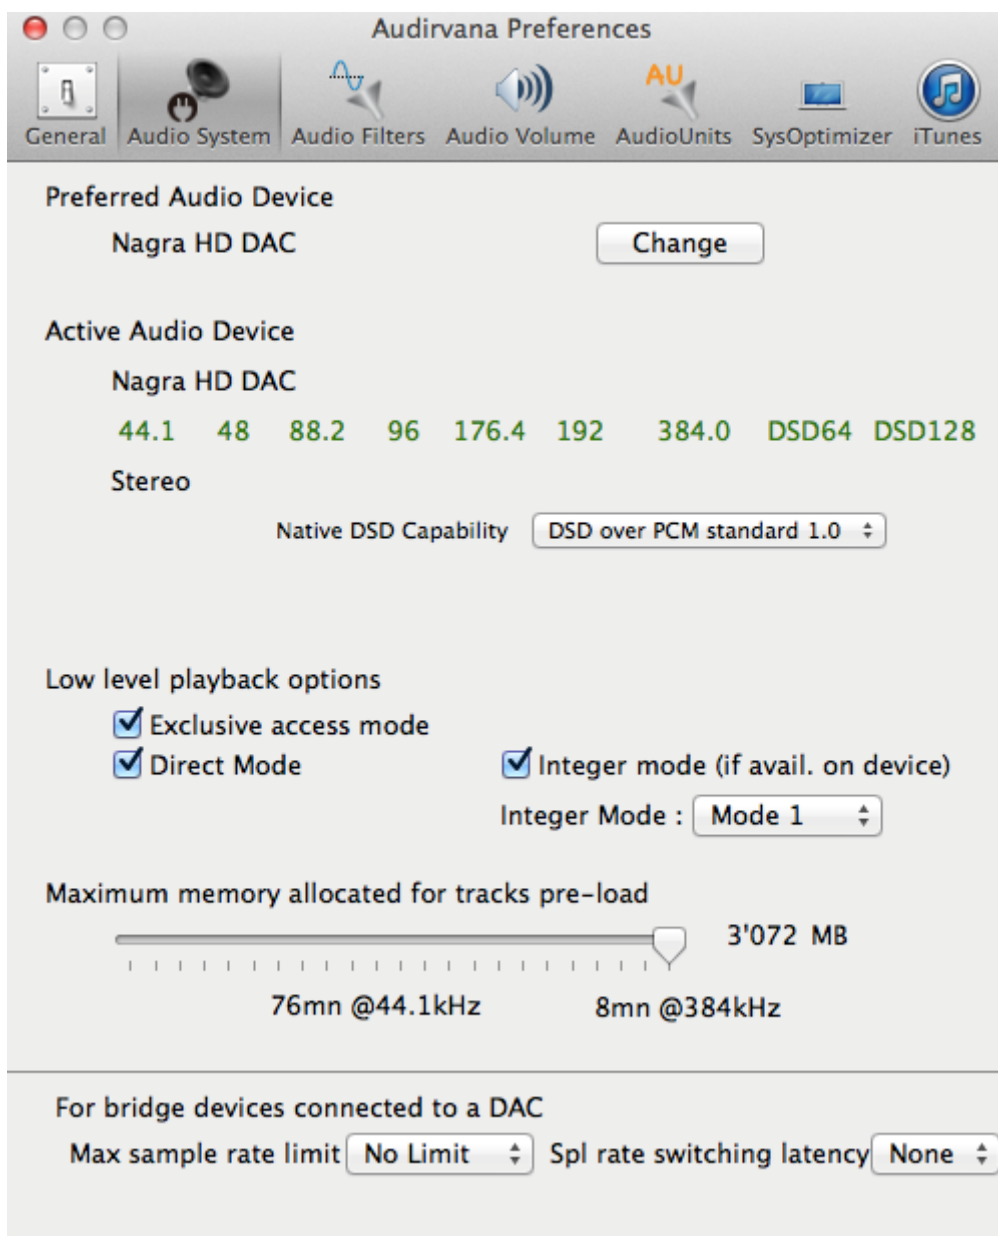

Go to **Audio System**

Change the **Preferred Audio Device** from the Built-in Output (as here) or any other audio devices to **Nagra HD DAC**

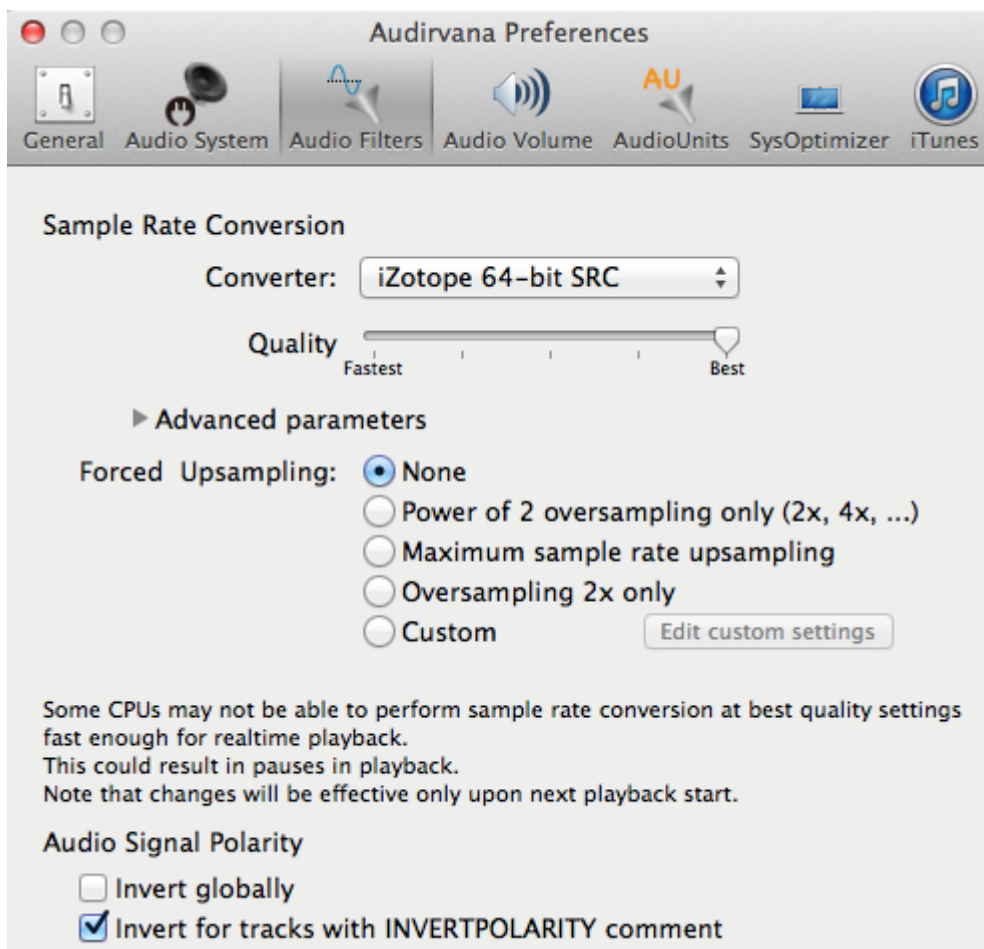

Once the Nagra HD DAC is selected, it will display the possible sampling frequencies.

In “Native DSD Capability” select **DSD over PCM standard 1.0**

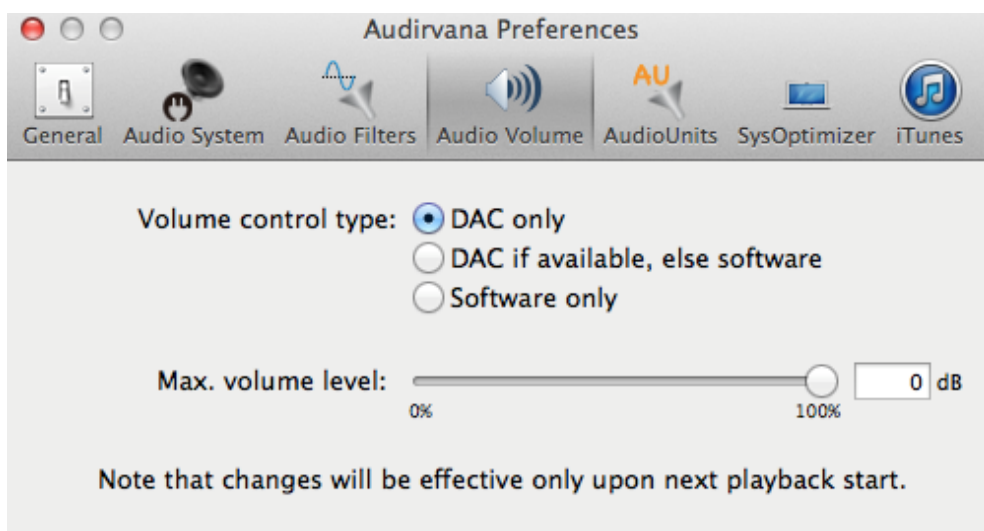

Make sure all the options are similar to this screenshot.

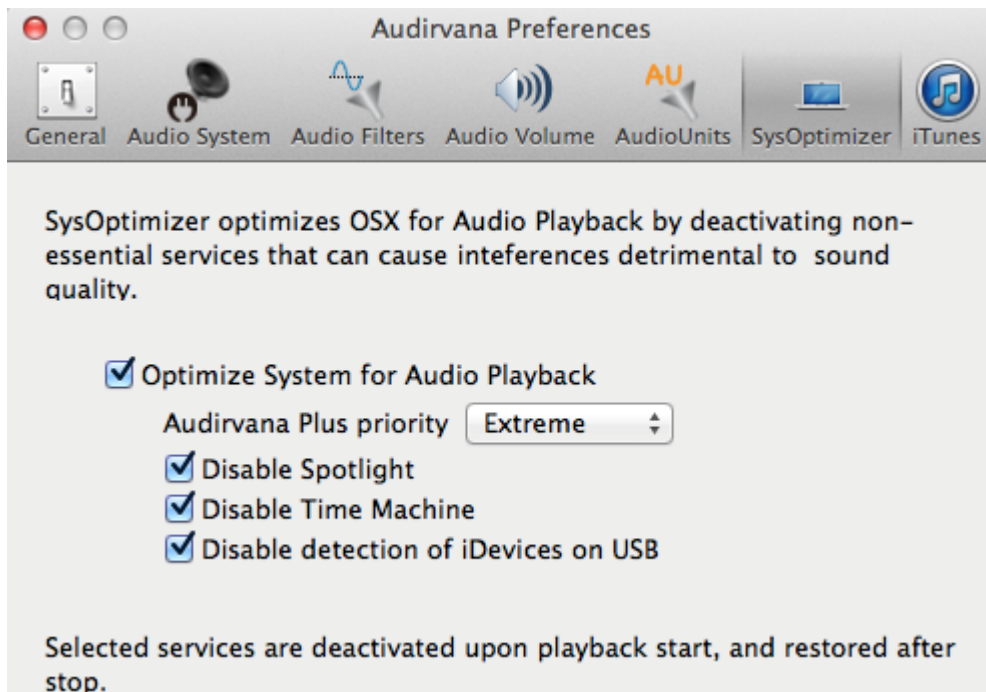

In the **Audio Filters** menu, select **None** for **Forced Upsampling**.

For **Volume control type**, make sure to select **DAC only**.

Following are the settings we use in the **SysOptimizer**, this is just a suggestion.

Enjoy your favorite music with the Nagra HD DAC!
